

Project Description

Design a personal homepage that includes your skills, classes, hobbies, etc. Implement this front-end only static page with vanilla HTML5, CSS3, ES6+, and Bootstrap5. Ensure that the page is formatted with Prettier and W3C compliant. The site should include at least 2 HTML pages with different URLs that were written manually and one AI generated page. At least one creative JS (Vanilla) feature should be included. The prompt and model used to create the AI page should be properly referenced. Additionally, complete a code review for another student's project.

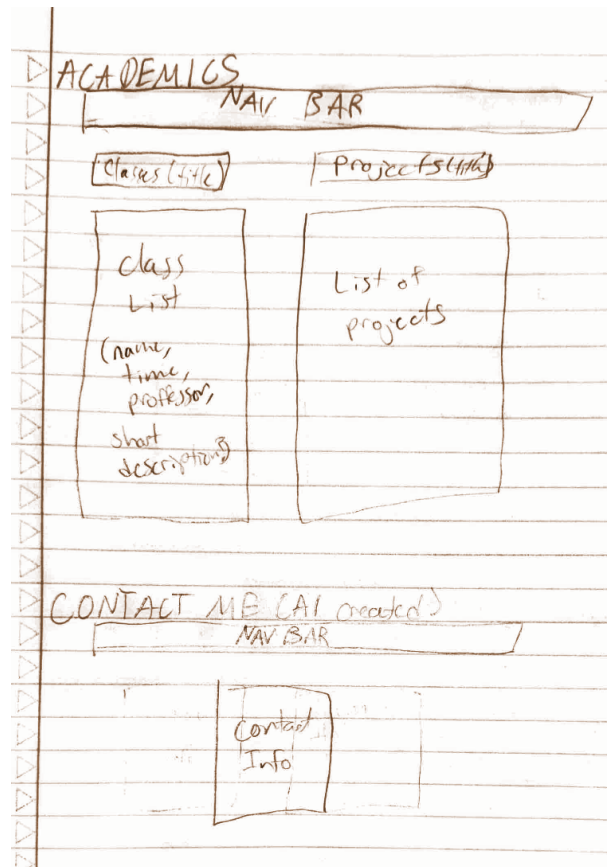

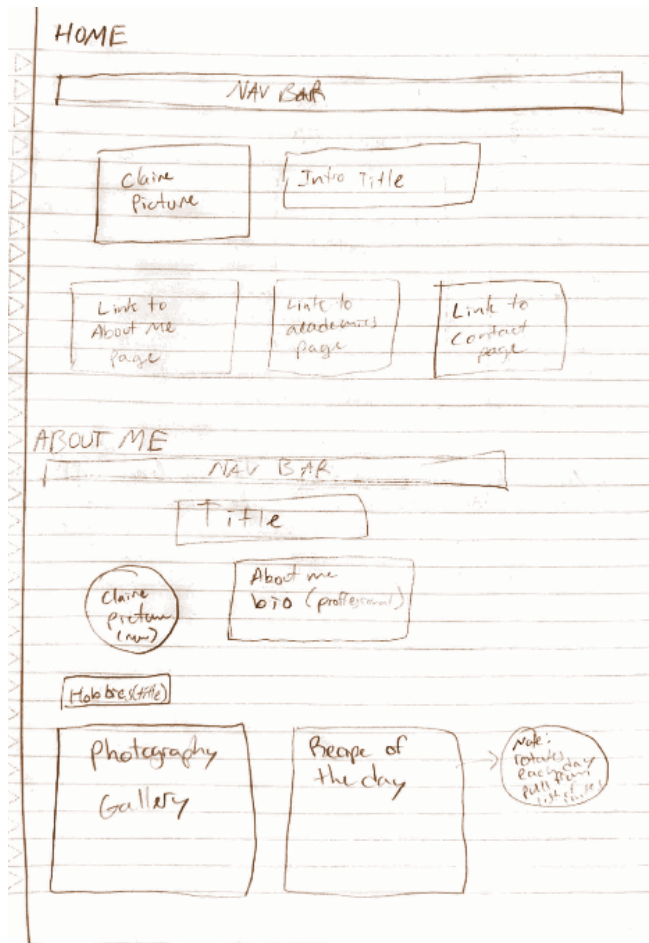

User Personas

1. Bob is a masters student. He is 26 and lives in the northeastern area of the US. He wants to learn more about his class peers and what academic background they have. He values efficiency and doesn't want to be confused on where to find information.
2. Robin is a professional AI engineer. She is 35 and has recently shifted career paths from a non-technical profession. As she develops her own portfolio website she is looking for examples of websites that were created from scratch and using AI tooling. She appreciates websites that have multiple pages, and doesn't like websites that are not visually appealing.

User Stories

1. As a member of a graduate student admissions committee I want to see what courses Claire Stanton has completed so that I can determine if she has a background that lends itself to my specific program.
 - 1.1 Users can view an academics page.
 - 1.2 Users can view a list of courses.
 - 1.3 The list of courses is organized by semester.
2. As a technical job recruiter I want to understand what projects Claire Stanton has worked on in order to understand what variety of technical experience she has working alone and in groups.
 - 2.1 Users can view a list of projects, with a title, short summary, and timeline.
 - 2.2 The page the projects are displayed on can be reached from any other page.
3. As a curious web-surfer I want to explore a visually interesting and well designed portfolio website in order to get inspiration for my own future websites.
 - 3.1 Users can use a consistent style navbar across all pages.
 - 3.2 Images and text are properly organized in a grid system.
 - 3.3 There is some way for users to interact with the site in a creative manner.

Wireframes

NOTE: Minor edits were made to the design of the 'About Me' page during implementation, instead of having a rotating recipe of the day I designed a rotating photo gallery that changes based on button pushes on the site.
